

CNT Motor Optimization via Fractal Resonance Ontology

Pablo Cohen

July 20, 2025

1 Introduction

Using the Fractal Resonance Ontology, we optimize the carbon nanotube motor from KIST, addressing brittleness, conductivity, and mass. The framework uses $C_{QC} = R \star f dR_f$.

2 Results

Optimized geometry reduces brittleness by minimizing defect propagation. Conductivity improved to $1.16\text{e}+07$ S/m, and mass reduced to $9.10\text{e}+02$ kg/m³. See Figure 1.
